What is Phentermine?

Phentermine is a **stimulant-based prescription medication** used to support **short-term weight loss** in adults with obesity or weight-related health conditions. It **suppresses appetite** by acting on the central nervous system, increasing the release of neurotransmitters like **norepinephrine**, which help control hunger and promote satiety.

Forms and Strengths of Phentermine

| Form Type | Brand / Example Name | Available Strengths | Use / Description |
|---------------------------|----------------------|-----------------------|--|
| Immediate-Release Tablets | Adipex-P, Ionamin | 15 mg, 30 mg, 37.5 mg | Reduces appetite quickly; best for daily weight management. |
| Capsules | Lomaira | 8 mg, 15 mg, 30 mg | Offers flexible dosing; easy to swallow. |
| Extended-Release | Fastin | 30 mg | Gradually releases medication to maintain appetite suppression throughout the day. |

How Phentermine Works in the Body

Phentermine acts as a **central nervous system stimulant**, similar to amphetamines. It stimulates the **release of norepinephrine**, which signals the brain to **reduce hunger**. By controlling appetite and increasing energy expenditure, Phentermine supports weight loss alongside **diet and exercise programs**. It is intended for **short-term use**, usually a few weeks, and should be taken **under strict medical supervision** to avoid potential side effects or dependency.
